(54) Title: METHOD AND APPARATUS FOR A SOURCE-INITIATED HANDOFF FROM A SOURCE CELLULAR WIRELESS NETWORK TO A TARGET NON-CELLULAR WIRELESS NETWORK

(57) Abstract: To address the need for an apparatus and method for handoff from a cellular wireless network to a non-cellular wireless network (WLAN, e.g.), the present application describes an access gateway (214) and a dual mode mobile station (201) that enable such handoffs. Dual mode MSs can determine when a handoff to a non-cellular network is preferred and request a handin (302) from the non-cellular network. The access gateway provides information to the MS (304) so that it can initiate a handoff through the serving cellular network. Triggering handoffs in this manner, allows cellular networks to handle handoffs to non-cellular networks in much the same way they handle inter-MS handoffs today, i.e., source initiated.

METHOD AND APPARATUS FOR A SOURCE-INITIATED HANDOFF  
FROM A SOURCE CELLULAR WIRELESS NETWORK TO A TARGET  
NON-CELLULAR WIRELESS NETWORK

5

Cross-Reference To Related Application

This application is related to a co-pending application entitled  
"METHOD AND APPARATUS FOR A TARGET-INITIATED HANDOFF  
10 FROM A SOURCE CELLULAR WIRELESS NETWORK TO A TARGET  
NON-CELLULAR WIRELESS NETWORK", filed on even date herewith,  
and assigned to the assignee of the instant application.

15

Field of the Invention

The present invention relates generally to wireless  
communication systems and, in particular, to handoff from a source  
cellular wireless network to a target non-cellular wireless network.

20

Background of the Invention

With the growing popularity of non-cellular wireless networks,  
25 such as wireless local area networks (WLANs), a demand for integration  
with overlaid or adjacent cellular networks has arisen in the marketplace.  
A solution for the integration of WLAN and cellular networks must  
include the ability to perform seamless handovers at least for voice  
services. Current cellular systems (e.g., GSM and CDMA) allow for  
30 such mobility between cell sites, but technology does not currently exist  
to allow calls to be maintained across a cellular-to-WLAN border.  
Without this capability, a voice call would be dropped at the border of

the two systems, or in an overlay situation, the call may continue but not under the control of the optimal or preferred system for that location. Therefore, a need exists for an apparatus and method for handoff from a cellular wireless network to a non-cellular wireless network.

5       An overview of some handoff prior art will support the novelty of the invention described below. Handoffs across different wireless technologies have been accomplished before, for example, between CDMA and analog cellular. CDMA to analog handoff based on DAHO (Database Assisted Handoff) is a specific example. DAHO initiates a  
10       handoff from CDMA to analog based on the existence of pilot signals and location information stored in the source cellular system. However, this is not a viable solution for a CDMA-WLAN system because the number of WLAN APs are much larger than analog base stations, thus requiring very large databases to be stored in each CDMA base site.  
15       Consequently, this approach would be cumbersome and complex.

      Similar to CDMA-analog handoffs, UMTS-GSM handoffs are known. These handoffs are enabled by incorporating changes in the GSM and UMTS base sites to recognize each other's cell sites. This is done by modifying the existing list of neighboring cells to include cells of  
20       the other technology. Specific changes to handover signaling between the MS and the BS is also required to enable the handover. The invention described below does not involve any changes to the neighbor lists or introduce any new handover signaling between the MS and the cellular BS.

25       Inter-MSC (mobile switching center) handoffs are defined in CDMA IS-95 B and GSM systems to provide handoffs between two base sites that are controlled by distinct MSCs. The Inter-MSC handoff procedures as defined in all cellular networks are initiated by the source MSC (the MSC currently serving the serving base site). The current IS-  
30       41 and MAP procedures (the interfaces governing the handoff procedure in CDMA and GSM respectively) only provide for source initiated handoffs. This can be seen, for example, in FIG. 1. FIG. 1

illustrates the inter-MSC handoff procedure for IS-95 systems based on the IS-41 specifications. (MAP procedures for GSM are similar.)

The known handoff procedure begins with the mobile station (MS) generating a CDMA Pilot Strength Measurement Message (PSMM) 1. The PSMM message contains the PN offsets and signal strengths ( $E_c/I_o$ ) of pilots in the MS's candidate and active set. The base site (BS) determines that the PN offset sent in the PSMM does not correspond to a cell under its control. The BS generates a Handoff Required message 2 containing the Cell Identifier List (with Cell ID, and optionally more information like MSC ID, LAC, etc). The source MSC then identifies the target BS and the associated MSC. It sets up a terrestrial circuit to the target MSC, and sends an IS41\_FACDIR2 message 3. The message contains the inter-MSC circuit ID, target cell ID, and other handoff-related parameters like channel condition, etc. The target MSC then initiates a Handoff Request 4 to the appropriate target BS. The message contains parameters that are mostly obtained (directly transferred) from the FACDIR2 message.

A Handoff Request Ack 5 is sent by the target BS to the MSC after radio resources and terrestrial circuits are allocated, and an IS\_41\_facdir2 6 is sent to the source MSC containing the parameters obtained from the Handoff Request Ack message. The Handoff Command 7 is then sent to the source BS to begin the handoff procedure, and the information in this message is used to generate an IS95\_Extended Handoff Direction Message 8, containing the new frequency channel and frame offset. The IS95\_Handoff Direction Message instructs the MS to switchover to the target cell/BS and start sending preamble frames on the reverse channel. The MS acks this message by sending an IS95\_Extended Handoff Direction Ack Message 9 to the source BS. The source BS then sends a Handoff Commenced message 10 to the source MSC indicating that the handoff is progress.

When ready, the MS sends an IS\_95 Handoff Completion message 11 to the target BS. The target BS then sends a Handoff

Complete message 12 to the target MSC, and the target MSC informs the source MSC of the successful handover with an MSONCH message 13. Finally, a Clear Command message 14 and a Clear Complete message 15 are exchanged in order to release resources between the source BS and the source MSC.

Two aspects of this prior art handoff messaging are particularly pertinent. First, it is the MS that identifies the handoff target to the source BS and MSC by providing the PN offset of the target. Second, it is the source MSC that initiates the handoff messaging (see FIG. 1, message 3) by translating the PN offset to a target BS/MSC. However, if the target system were a WLAN system, the handoff target would be a WLAN access point (AP), and presently there is no messaging to enable either the MS or the source MSC to identify this target WLAN AP.

#### Brief Description of the Drawings

FIG. 1 is a message flow diagram of prior art messaging exchanged by system components to affect a handoff.

FIG. 2a is a block diagram depiction of a communication system in accordance with an embodiment of the present invention.

FIG. 2b is a block diagram depiction of communication system components in accordance with an embodiment of the present invention.

FIG. 3 is a messaging flow diagram of messaging and information exchanged by system components to affect a handoff in accordance with an embodiment of the present invention.

### Detailed Description of Embodiments

To address the need for an apparatus and method for handoff from a cellular wireless network to a non-cellular wireless network (WLAN, e.g.), the present application describes an access gateway and a dual mode mobile station that enable such handoffs. Dual mode MSs can determine when a handoff to a non-cellular network is preferred and request a handin from the non-cellular network. The access gateway provides information to the MS so that it can initiate a handoff through the serving cellular network. Triggering handoffs in this manner, allows cellular networks to handle handoffs to non-cellular networks in much the same way they handle inter-MSC handoffs today, i.e., source initiated.

The disclosed embodiments can be more fully understood with reference to FIGs. 2a, 2b, and 3. FIG. 2a is a block diagram depiction of communication system 200 in accordance with an embodiment of the present invention. Communication system 200 comprises a known wireless local area network (WLAN), a known cellular network, and components to interface them together, the combination suitably modified to implement the present invention. The WLAN is a known wireless infrastructure such as that conforming to the IEEE 802.11 standard. The cellular network is a well-known Code Division Multiple Access (CDMA) network, based on the Telecommunications Industry Association / Electronic Industries Association (TIA/EIA) standard IS-95. (The TIA/EIA can be contacted at 2001 Pennsylvania Ave. NW, Washington, D.C. 20006). In various alternative embodiments, communication system 200 may utilize other cellular communication protocols such as, but not limited to, GSM, UMTS, IS-2000, and "IDEN."

The cellular network of communication system 200 includes known radio access network (RAN) entities, such as base site (BS) 250 (comprising a base site controller and one or more base transceiver stations), mobile switching center (MSC) 251 (which interfaces with

PSTN 205), and home location register (HLR) 252. Communication system 200 further includes WLAN access point (AP) 210, internet protocol (IP) network 211, circuit gateway 212, private branch exchange (PBX) 213, and cellular access gateway (CAG) 214. Both the WLAN and cellular network of system 200 support voice services. The WLAN supports voice over a pico-cellular environment, while the cellular network supports voice over the macro-cellular environment. As integrated into system 200, these networks further support voice-session mobility from the cellular network to the WLAN.

Communication system 200 also includes mobile stations (MSs), such as MS 201. MS 201 is a dual-mode phone capable of communicating with both the cellular network (e.g., BS 250) and the WLAN (e.g., AP 210). FIG. 2b depicts MS 201 in greater detail. MS 201 comprises well-known entities such as processor 204, dual-mode transmitter 202, and dual-mode receiver 203. Transmitters, receivers, and processors as used in MSs are all well known in the art. This common set of MS components is adapted using known telecommunications design and development techniques to implement the wireless unit aspect of the present invention. Processors typically comprise components such as microprocessors, digital signal processors, memory, and/or logic circuitry designed to implement algorithms that have been expressed as computer instructions and/or in circuitry. Given an algorithm or a logic flow, those skilled in the art are aware of the many design and development techniques available to implement a processor that performs the given logic.

FIG. 2b also depicts CAG 214 in greater detail. CAG 214 comprises a known network interface 215 and cellular interworking device 216. Network interface 215 provides an access gateway interface to IP network 211, while cellular interworking device 216 performs cellular mobility interworking (e.g., interworking for registration, authentication, and handoff) by interfacing with MSC 251, HLR 252, PBX 213, and circuit gateway 212. Cellular interworking device 216 also

performs PSTN interworking by interfacing with PSTN 205 using landline signaling protocols such as ISDN User Part (ISUP) and/or Multi Frequency R1 (MFR1). Generally, cellular and PSTN interworking components are known in the art. These components in addition to  
5 network interface components are combined and adapted using known telecommunications design and development techniques to implement the access gateway aspect of the present invention. Given a protocol or a message flow, those skilled in the art are aware of the many design and development techniques available to implement a networking  
10 platform that performs the specified function.

Furthermore, those skilled in the art will recognize that FIGs. 2a and 2b do not depict all of the network equipment and devices necessary for system 200 to operate fully but only those system blocks and logical entities particularly relevant to the description of  
15 embodiments of the present invention. Those skilled in the art are aware of the many ways the necessary devices and entities can be implemented and/or purchased from wireless networking companies and wireless communications companies such as "MOTOROLA."

High-level operation of a first embodiment of the present  
20 invention occurs substantially as follows. In the first embodiment, MS 201's dual mode functionality allows it to support voice services over the cellular network and the WLAN. Thus, MS 201 supports a standard cellular voice call model such as one specified by the GSM, CDMA, or "IDEN" technologies, for example. For the WLAN domain, MS 201  
25 supports a voice over IP (VoIP) protocol, such as H.323, Session Initiation Protocol (SIP), or the Skinny Protocol of "CISCO." The VoIP protocols are used between MS 201 and circuit gateway 212. Circuit gateway 212, when connected to PBX 213, provides the interworking necessary for the desired PBX feature transparency to MS 201. Also, for  
30 signaling with WLAN AP 210, MS 201 supports IEEE 802.11 signaling in the first embodiment, but signaling types such as Bluetooth or HiperLAN 2 may additionally or alternatively be supported in other embodiments.

Lastly, the dual mode capability of MS 201 allows it to measure the signal strength of the WLAN AP(s), such as AP 210, as well as the cellular BTS(s), such as those of BS 250.

Generally, in the first embodiment, CAG 214 interworks the voice  
5 call model and mobility management within the WLAN domain with the voice call model and mobility schemes of the standard macro-cellular domain. It provides the required interworking between the WLAN and cellular domain in the areas of cellular registration, authentication, and cross-technology handovers. In addition, it also interworks the cellular  
10 network with the existing voice infrastructure (i.e., PBX 213 and circuit gateway 212) in the WLAN domain.

In the first embodiment, cellular interworking device 216 provides the appearance to a GSM / "IDEN" (MAP) or a CDMA (IS-41) cellular network that the WLAN domain is another standard cellular network.  
15 Cellular interworking device 216 enforces message discrimination by sending/receiving MAP/IS-41 messaging to/from an MSC/HLR. Cellular interworking device 216 effectively emulates either an MSC or a VLR role to the far-end macro-cellular domain.

In the first embodiment, cellular interworking device 216 also  
20 keeps subscriber profile, supports authentication, supports registration, etc. At a minimum, cellular interworking device 216 emulates a portion of the cellular VLR. It provides higher-layer mobility support to allow CAG 214 to act like a standard MSC to the macro-cellular MSC/HLR domain.

In addition, in the first embodiment, cellular interworking device  
25 216 provides service logic similar to call processing, but not a complete set. The distinction typically is between service/feature "control" and service/feature "execution." There are only a few scenarios (e.g. handoff from cellular to WLAN) where cellular interworking device 216 provides  
30 full call processing, allowing the connection to be made (i.e., control) and setting up the bearer connection through CAG 214 (i.e., basic execution). Since CAG 214 is only involved in inter-domain session

establishment and handoffs, these scenarios require functionality to maintain the basic state of the subscriber's session. In most other scenarios, like a PSTN to WLAN session establishment, PBX 213 provides all call processing.

5 In the first embodiment, the general role of PBX 213 is to terminate circuit voice calls and provide call processing with access to voice features as if MS 201 were a typical wired telephone in the enterprise domain. In addition, the general purpose of circuit gateway 212 is to interwork the voice call models in the WLAN-IP domain and the  
10 typical circuit (i.e., PBX) domain. This requires both bearer and control interworking. The voice bearer and signaling from dual mode MS 201 and WLAN APs connect over IP and may use IP telephony call model conventions. Since the IP telephony conventions do not work with the typical wired PBX, circuit gateway 212 provides this important  
15 interworking to PBX 213.

Messaging-focused operation of the first embodiment of the present invention occurs substantially as follows. FIG. 3 is a messaging flow diagram 300 of messaging and information exchanged by system components to affect a handoff from a cellular wireless network to a  
20 non-cellular wireless network (e.g., a WLAN) in accordance with the first embodiment of the present invention. Already involved in a call, MS 201 receives call information (301) via serving BS 250 and associated (i.e., serving) MSC 251. This call information refers to real-time call content such as voice or video-telephony.

25 As MS 201 moves within the coverage area of WLAN AP 210, MS 201 performs signal strength measurements and establishes contact with AP 210. Establishing contact typically involves obtaining an IP address for itself (MS 201) and for an access gateway (CAG 214, in the first embodiment). At some point, MS 201 determines that a handoff  
30 from serving BS 250 to AP 210 is preferred. MS 201 may determine this based on criteria such as the relative signal strength of BS 250 and AP 210, the relative cost of wireless service, and/or user indications of

preference. For example, the user may set an MS option to switch to WLAN service whenever signal conditions allow or whenever the WLAN service is determine to be cheaper.

Having determined that a handoff is preferred, processor 204  
5 sends a handin request (302) to CAG 214. The request is sent to CAG 214 via transmitter 202, WLAN AP 210, and IP network 211. Thus, the handin request is sent using an IP packet addressed to CAG 214. The handin request contains an indication of from which cellular wireless network MS 201 is attempting to handoff, i.e., which MSC is serving MS  
10 201. The indication takes the form of a serving cell identifier which CAG 214 can use to determine the corresponding serving MSC. In the first embodiment, this serving cell identifier is the PN offset of MS 201's serving cell within BS 250, while in an alternative GSM embodiment, the serving cell identifier may be the Base Transceiver Station Identity Code  
15 (BSIC) of MS 201's serving cell.

Cellular interworking device 216 of CAG 214 receives the IP-packetized handin request from MS 201 via network interface 215. In response to MS 201's handin request, cellular interworking device 216 sends a handin request acknowledgment (304) to MS 201. This handin  
20 request acknowledgment is sent via network interface 215, IP network 211, and WLAN AP 210. Importantly, the acknowledgment contains a handoff-target identifier, such as a cell identifier. In the first embodiment, this handoff-target identifier is a value that is predefined to trigger an automatic handoff determination by the cellular wireless network from  
25 which the MS is attempting to handoff. In other words, it could be either a "spoof" value or a valid cell identifier that will be recognized (i.e., the cellular network has been preprogrammed to recognize) as a trigger for handoff to this non-cellular network. In an alternative embodiment, the handoff-target identifier may simply be a valid cell identifier for the non-  
30 cellular network that will not be specially recognized.

Processor 204 of MS 201 receives the handin request acknowledgment via WLAN AP 210 and receiver 203. After receiving

the acknowledgment, processor 204 sends a signal strength message (306) via transmitter 202 to serving BS 250. This signal strength message comprises values intended to trigger a handoff determination. Specifically, in the first embodiment, the signal strength message is a  
5 CDMA PSMM containing the handoff-target identifier from the handin request acknowledgment. Thus, the PSMM is sent in order to trigger a handoff to the WLAN, as identified by the handoff-target identifier. Alternatively, the PSMM could contain a regular cell identifier for the WLAN but with an artificial signal strength value associated with the cell  
10 identifier, which is intended to trigger a handoff to the WLAN identified by the cell identifier. In an alternative GSM embodiment, the signal strength message could instead be either a MEAS\_RES (Measurement Result) message or a MEAS\_REP (Measurement Report) message.

Thus, it is the handoff source (i.e., the serving cellular network)  
15 that initiates the handoff of MS 201 from the cellular network to the WLAN. However, for this to occur, handoff-target information is sent to the MS by the target network (i.e., the WLAN). This information is then used by the MS to trigger the handoff procedures. Note, that the cellular network needs to be able to recognize the handoff-target identifier that it  
20 receives in the PSMM, so some sort of agreement that addresses this between the network operators of the WLAN and cellular network is envisioned.

BS 250 receives the PSMM and determines that a handoff for MS 201 should be initiated. BS 250 sends a handoff required message  
25 (308) to MSC 251, and serving MSC251 then sets up the necessary circuits and sends a FACDIR2 message. CAG 214 receives the MAP FACDIR2 message (310) from serving MSC 251 and sends a MAP facdir2 message (312) back in response.

Serving MSC 251 then sends an initiate handoff message (314)  
30 to serving BS 250. In the first embodiment, this initiate handoff message would be a Clear Command signaling serving BS 250 to clear its wireless resources supporting MS 201. Release channel messaging

particular to the cellular network (e.g., IS-95 or GSM messaging) is then exchanged (316) between MS 201 and BS 250. For example, processor 204 of MS 201 receives a handoff release indication from BS 250 via receiver 203. In the first embodiment, this indication would be a CDMA  
5 Handoff Direction Message, while in an alternative GSM embodiment this indication may be a HND\_CMD (handoff command) message.

After completing channel release messaging, processor 204 of MS 201 sends a handoff complete indication (318) to CAG 214 via transmitter 202, WLAN AP 210, and IP network 211. Thus, the handoff  
10 complete indication is sent using an IP packet addressed to CAG 214. Cellular interworking device 216 of CAG 214 receives the IP-packetized handoff complete indication from MS 201 via network interface 215. In response to this indication, cellular interworking device 216 sends an indication to MSC 251 that the MS is on channel (320). Specifically, this  
15 indication is a MAP MSONCH message.

MSC 251 then switches the MS 201 call information to CAG 214. CAG 214 receives the call information (via DS0 signaling, e.g.) and routes (321) it to MS 201 via IP network 211 and WLAN AP 210. Thus, MS 201 completes a handoff from the cellular network to the WLAN,  
20 continuing to receive its call information via MSC 251, CAG 214, and WLAN AP 210.

In the foregoing specification, the present invention has been described with reference to specific embodiments. However, one of ordinary skill in the art will appreciate that various modifications and  
25 changes may be made without departing from the spirit and scope of the present invention as set forth in the appended claims. Accordingly, the specification and drawings are to be regarded in an illustrative rather than a restrictive sense, and all such modifications are intended to be included within the scope of the present invention. In addition, those of  
30 ordinary skill in the art will appreciate that the elements in the drawings are illustrated for simplicity and clarity, and have not necessarily been drawn to scale. For example, the dimensions of some of the elements

in the drawings may be exaggerated relative to other elements to help improve an understanding of the various embodiments of the present invention.

Benefits, other advantages, and solutions to problems have been  
5 described above with regard to specific embodiments of the present invention. However, the benefits, advantages, solutions to problems, and any element(s) that may cause or result in such benefits, advantages, or solutions, or cause such benefits, advantages, or solutions to become more pronounced are not to be construed as a  
10 critical, required, or essential feature or element of any or all the claims. As used herein and in the appended claims, the term "comprises," "comprising," or any other variation thereof is intended to refer to a non-exclusive inclusion, such that a process, method, article of manufacture, or apparatus that comprises a list of elements does not include only  
15 those elements in the list, but may include other elements not expressly listed or inherent to such process, method, article of manufacture, or apparatus.

The terms a or an, as used herein, are defined as one or more than one. The term plurality, as used herein, is defined as two or more  
20 than two. The term another, as used herein, is defined as at least a second or more. The terms including and/or having, as used herein, are defined as comprising (i.e., open language). The term coupled, as used herein, is defined as connected, although not necessarily directly, and not necessarily mechanically. The term program, as used herein, is  
25 defined as a sequence of instructions designed for execution on a computer system. A program, or computer program, may include a subroutine, a function, a procedure, an object method, an object implementation, an executable application, an applet, a servlet, a source code, an object code, a shared library/dynamic load library and/or other  
30 sequence of instructions designed for execution on a computer system.

What is claimed is:

## Claims

1. An access gateway able to facilitate handoff from a cellular wireless network to a non-cellular wireless network, the access gateway  
5 comprising:
  - a network interface; and
  - a cellular interworking device, communicatively coupled to the network interface,
    - adapted to receive a handin request from a mobile station (MS)
    - 10 via a non-cellular access point and the network interface,
    - adapted to send a handin request acknowledgment to the MS via the non-cellular access point and the network interface in response to the handin request,
    - adapted to receive a handoff indication from a mobile switching
    - 15 center (MSC) associated with the MS,
    - adapted to receive a handoff complete indication from the MS via the non-cellular access point and the network interface, and
    - adapted to send an indication to the MSC that the MS is on channel, in response to the handoff complete indication.
- 20 2. The access gateway of claim 1, wherein the cellular interworking device is adapted to perform cellular mobility interworking by interfacing with MSCs and home location registers (HLRs).
- 25 3. A method for facilitating handoff of a mobile station (MS) from a cellular wireless network to a non-cellular wireless network comprising:
  - receiving, by an access gateway, a handin request from the MS via a non-cellular access point;
  - 30 sending, by the access gateway in response to the handin request, a handin request acknowledgment to the MS via the non-cellular access point;

receiving, by the access gateway, a handoff indication from a mobile switching center (MSC) associated with the MS;

receiving, by the access gateway, a handoff complete indication from the MS via the non-cellular access point; and

5 sending, by the access gateway in response to the handoff complete indication, an indication that the MS is on channel to the MSC associated with the MS.

4. The method of claim 3, further comprising:

10 receiving, by the access gateway, call information for the MS from the MSC; and

routing, by the access gateway, the call information to the MS via the non-cellular access point.

15 5. The method of claim 3, further comprising sending, by the access gateway, a MAP facdir2 message to the MSC in response to the MAP FACDIR2 message.

6. A mobile station (MS) able to handoff from a cellular wireless network to a non-cellular wireless network, the MS comprising:

a transmitter;

a receiver; and

a processor, communicatively coupled to the transmitter and receiver,

25 adapted to send, via the transmitter, a handin request to an access gateway via a non-cellular access point,

adapted to receive, via the receiver, a handin request acknowledgment from the access gateway via the non-cellular access point,

30 adapted to send, via the transmitter after receiving the handin request acknowledgment, a signal strength message to a serving

cellular base site, wherein the signal strength message comprises values intended to trigger a handoff determination,

adapted to receive, via the receiver, a handoff release indication from a serving cellular base site, and

5 adapted to send, via the transmitter and after receiving the handoff release indication, a handoff complete indication to the access gateway via the non-cellular access point.

7. A method for handing off from a cellular wireless network to a  
10 non-cellular wireless network comprising:

sending, by a mobile station (MS), a handin request to an access gateway via a non-cellular access point;

receiving, by the MS, a handin request acknowledgment from the access gateway via the non-cellular access point;

15 sending, by the MS after receiving the handin request acknowledgment, a signal strength message to a serving cellular base site, wherein the signal strength message comprises values intended to trigger a handoff determination;

receiving, by the MS, a handoff release indication from the  
20 serving cellular base site; and

sending, by the MS after receiving the handoff release indication, a handoff complete indication to the access gateway via the non-cellular access point.

25 8. The method of claim 7, wherein the handin request comprises an indication of from which cellular wireless network the MS is attempting to handoff.

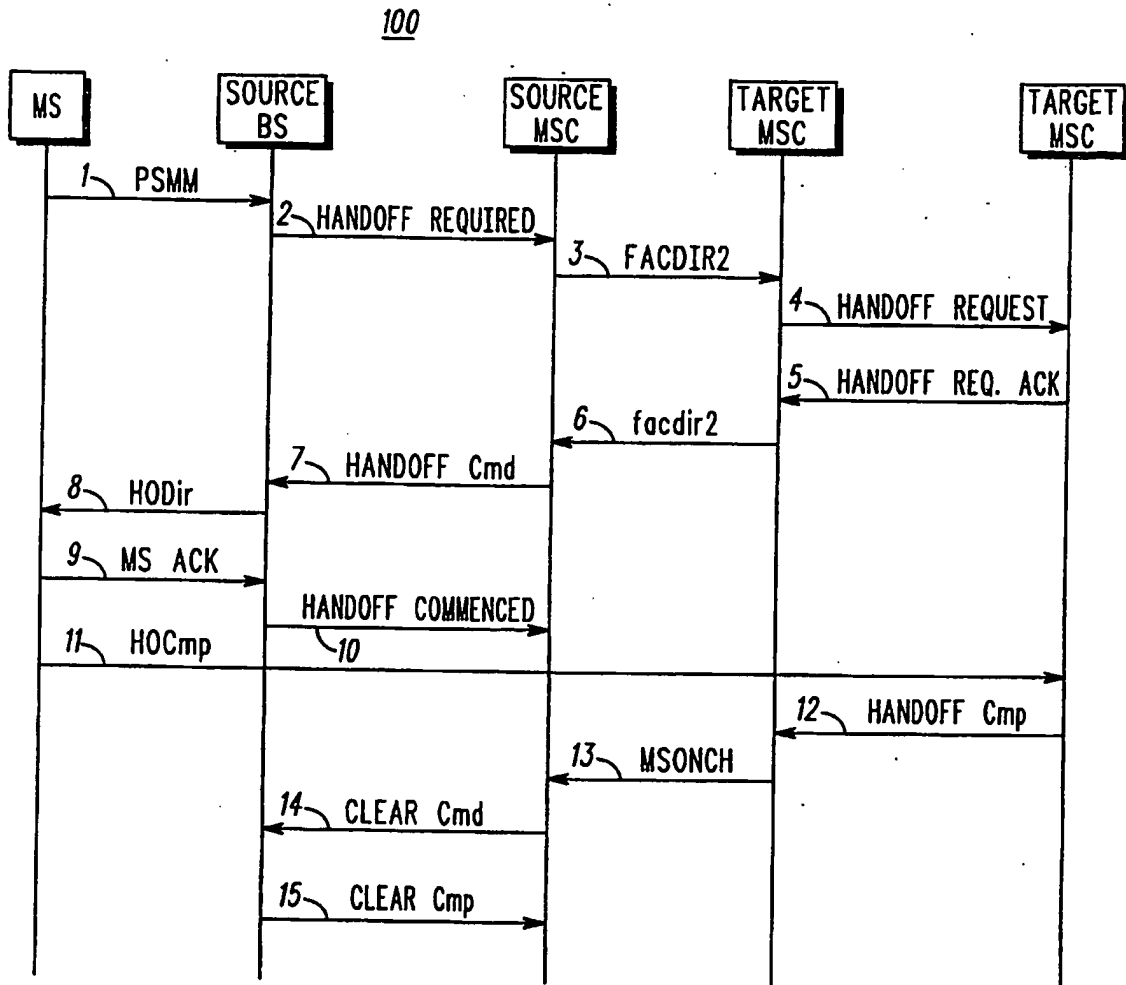

9. The method of claim 7, wherein the handin request  
30 acknowledgment comprises a handoff-target identifier.

10. The method of claim 7, further comprising:

receiving, by the MS, call information via the serving cellular base site and a mobile switching center (MSC) associated with the MS; and  
receiving, by the MS, call information via the non-cellular access point, the access gateway, and the MSC.

(54) Title: METHOD AND APPARATUS FOR A SOURCE-INITIATED HANDOFF FROM A SOURCE CELLULAR WIRELESS NETWORK TO A TARGET NON-CELLULAR WIRELESS NETWORK

(57) Abstract: To address the need for an apparatus and method for handoff from a cellular wireless network to a non-cellular wireless network (WLAN, e.g.), the present application describes an access gateway (214) and a dual mode mobile station (201) that enable such handoffs. Dual mode MSs can determine when a handoff to a non-cellular network is preferred and request a handin (302) from the non-cellular network. The access gateway provides information to the MS (304) so that it can initiate a handoff through the serving cellular network. Triggering handoffs in this manner, allows cellular networks to handle handoffs to non-cellular networks in much the same way they handle inter-MSC handoffs today, i.e., source initiated.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US04/01289

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) : H04Q 7/00

US CL : 370/331

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 370/331,338,332,401; 455/436,437,552.1,553.1

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	US 2002/0085516 A1 (BRIDGELALL) 04 July 2002, Fig. 13, para [0075]-[0083].	1-10
A,P	US 2004/0002335 A1 (PAN et al) 01 January 2004, Fig. 1, para. [0024]-[0027]	1-10
A,P	US 2003/0117978 A1 (HADDAD) 26 June 2003, para. [0020]-[0021]	1-10

☐ Further documents are listed in the continuation of Box C.

☐ See patent family annex.

\* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T"

later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X"

document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y"

document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&"

document member of the same patent family

Date of the actual completion of the international search

06 July 2004 (06.07.2004)

Date of mailing of the international search report
